HVAC equipment or features that are required by code must be identified early in the design process. This is one of the reasons it makes sense to develop the controls sequence early in the design process. Doing so allows for a complete and comprehensive coordination effort as the design is developed.

[ANSI/ASHRAE/IES Prepared by Pacific Standard 90.1-2016: HVAC](#)

HVAC system is designed to meet specific values of temperature, relative humidity, and air changes frequency within different areas in hospital based on standards of design. For example, high risk areas such as operating rooms and intensive care units require special ventilation systems through filtration systems (e.g., HEPA filters) and pressure relationship to adjacent areas. In general ...

Overview. Central heating differs from space heating in that the heat generation occurs in one place, such as a furnace room or basement in a house or a mechanical room in a large building (though not necessarily at the geometrically "central" point). The heat is distributed throughout the building, typically by forced-air through ductwork, by water circulating through pipes, or by steam fed ...
