In mathematics, a function is a binary relation between two sets that associates every element of the first set to exactly one element of the second set. Typical examples are functions from integers to integers, or from the real numbers to real numbers.. Functions were originally the idealization of how a varying quantity depends on another quantity.

In effect, the axiom blocks circularity by introducing a hierarchy (or stratification) that is similar to type theory in some ways, and dissimilar in others. (Details can be found in the entry on Quine's New Foundations.) In contrast to Zermelo's, von Neumann's and Quine's strategies, which are in a sense purely set theoretic, there have also been attempts to avoid Russell's paradox ...
